

VOERMOL SUPERLAMB PELLETS

Class: Protein, Mineral and Trace Mineral Supplement for Ruminants

VOERMOL SUPERLAMB PELLETS is a high quality, ready-mixed, supplement for ruminants in pellet form and is specially developed for the finishing of weaner lambs on a dense stand of abundant, actively growing, palatable and lush green natural veld or cultivated pastures of high quality.

- is easy to handle and convenient to use. It is ideal for situations where problems are experienced with mixing licks due to insufficient labour and/or lick troughs, also where grain is unavailable or too expensive to use;
- limits wastage and loss because of wind as it is in pellet form;
- is molasses based, therefore, improves palatability which promotes adequate intake on green pastures and Karoo Shrubs where frequent problems are experienced with lick intake;
- is urea-free and contains a very high level of good quality natural protein;
- supplies a high level of natural protein (bypass protein) which promotes muscle growth, stimulates pasture intake and improves feed conversion;
- supplies a high level of energy and minerals, which, together with bypass protein, improve growth and feed conversion;
- contains an ammonium salt to help prevent bladder stones in male animals;
- contains medicaments which improve energy utilisation, accelerate growth, improve feed conversion and assist with the prevention of coccidiosis;
- can be used as a creep feed for lambs;
- promotes earlier finishing of weaner lambs by up to 30 days;
- increases the carcass value of a lean non-marketable animal by improving its grade;
- requires less input in terms of facilities, management and labour than feedlot finishing and creates a stress free environment;
- is highly suitable because of its high bypass protein content for late pregnant ewes with twin foetuses, lactating ewes nursing twins, flush feeding of breeding ewes and rams prior to mating, as well as for growing out young replacement ewes on any type of green pastures and Karoo Shrubs. It can also be used as a supplement for rearing rams on pastures. The high bypass protein intake promotes testicular growth and sperm production of rams, which in turn improves the lambing percentage;
- is a lick and not a complete feed, therefore sufficient green pastures should always be available.

VOERMOL

Voermol Superlamb Pellets promotes trouble-free and profitable finishing of weaner lambs on any type of green pastures. The success of a supplement, in pellet form, is partly attributable to the non-selective, even intake thereof as well as the fact that almost all animals will eat it.

COMPOSITION OF VOERMOL SUPERLAMB PELLETS				
REG NO V17425 (Act 36/1947)				
		(g/kg)	(mg/kg)	
Crude Protein	(min)	160	Manganese	200
Crude Fibre	(max)	120	Copper	25
Moisture	(max)	120	Cobalt	3.5
Calcium	(min/max)	8/10	Iron	95
Phosphorus	(min)	3	Iodine	4
Magnesium	(min)	2	Zinc	200
Sulphur	(min)	2.4	Selenium	1
			Vitamin A (IU/kg)	12 750

Packaging – 50 kg

NB. Voermol Superlamb Pellets contain medicaments and can be toxic if the recommended intake rates are exceeded or if it is fed to horses and certain types of game.

FEEDING INSTRUCTIONS AND RECOMMENDED INTAKE FOR FINISHING.

Voermol Superlamb Pellets is a ready-mixed supplement in pellet form. It should be fed to weaner lambs daily, in feeding troughs or on hard surfaces on a dense stand of abundant, actively growing, palatable, lush green and leafy pastures at 300 to 500 g/weaner lamb. Allow adequate feeding space so that all the animals can eat simultaneously. Self-feeders are not advisable as animals can take in more than the recommended rate, which can be toxic. It is highly recommendable to allow a period of 7 to 10 days for animals to adapt to **Voermol Superlamb Pellets**, before moving them onto palatable green pastures.

FOR THE BEST POSSIBLE GROWTH RESPONSE AND FEED CONVERSION, WHERE WEANER LAMBS ARE FINISHED ON GREEN PASTURES, THE FOLLOWING RECOMMENDATIONS SHOULD BE ADHERED TO:

- A lush dense stand of abundant actively growing, palatable and green leafy pasture of high quality should be available at all times;
- the better the quality of the pastures, the higher the growth rate of the animals;

VOERMOL

-
- allow animals only to graze the leaves (not shorter than 5 to 8 cm in the case of lambs) and move them before they start grazing the stems;
 - a suitable ear implant should be used;
 - **Voermol Superlamb Pellets** should be fed daily in feeding troughs, allowing adequate feeding space for each animal;
 - animals should be divided into homogeneous groups according to mass, condition, breed and sex. They should be fully grown out (at least 28 to 32 kg for lambs) and should have a high growth potential;
 - a lower carrying capacity and smaller groups with a quicker rotation (every 7 to 14 days or shorter) gives a far better response than a higher carrying capacity and larger groups with a slower rotation or continuous grazing and
 - animals should be vaccinated against prevailing diseases and dosed with an effective internal parasite remedy.

ALTERNATIVE USES

Voermol Superlamb Pellets, at a feeding level of 300 to 500 g/small stock/day, is highly suitable as a supplement for high producing and reproducing ewes (i.e. young ewes lambing for the first time, late pregnant ewes with twin foetuses, lactating ewes nursing twins and flush feeding of breeding ewes) as well as for the optimal growing out of weaner lambs and replacement ewes on any type of green pastures as well as Karoo Shrubs.

Voermol Superlamb Pellets is highly suitable for the flush feeding of breeding rams 60 days prior to mating, rearing young breeding rams on pastures or in a veld ram test, as well as for the preparation and finishing of rams for auctions and shows. Feed 300 to 500 g/ram/day in feeding troughs or on the ground, allowing feeding space for each ram, on any type of pasture as well as Karoo Shrubs.
